

Clarkson Institute Summer School: Examples Sheet 4 - Product groups

Please send all comments and corrections to jmm232@cam.ac.uk.

Direct products

- (a) Construct the group table of $C_2 \times C_3$. Find the orders of all the elements, and hence verify the isomorphism $C_2 \times C_3 \cong C_6$.
(b) Construct the group table of $C_3 \times C_3$. Find the orders of all the elements, and hence verify that $C_3 \times C_3 \not\cong C_9$.
- Is D_3 isomorphic to the direct product of two non-trivial groups? Exhibit two such groups, or show that none can exist.
- Which of the following direct product groups are isomorphic? Justify your answer.

$$C_{12}, \quad C_6 \times C_2, \quad C_3 \times C_4, \quad C_3 \times C_2 \times C_2.$$

- Suppose that G_1, G_2 are groups.
 - Let $H_1 \leq G_1, H_2 \leq G_2$ be subgroups of G_1, G_2 respectively. Show that $H_1 \times H_2$ is a subgroup of $G_1 \times G_2$.
 - Is every subgroup of $G_1 \times G_2$ of the form $H_1 \times H_2$, where $H_1 \leq G_1, H_2 \leq G_2$? Give a proof or counterexample as appropriate.

The direct product theorem

- Let H, K be the groups of matrices, under matrix multiplication, generated by the sets:

$$\left\{ \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} \right\}, \quad \left\{ \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \right\}$$

respectively. Let G be the smallest group of matrices containing both H, K as subgroups. Show that $G \cong H \times K$.

- Using the direct product theorem, show that $\mathbb{Z}_{35}^* \cong C_4 \times C_6$.
- Using the direct product theorem, provide an alternative proof that $C_n \times C_m \cong C_{nm}$ if and only if n, m share no common factors except one.
- Show that the full cubic group is isomorphic to $C_2 \times O$, where O is the chiral cubic group. [Hint: $-I$, where I is the identity, is a symmetry of the cube.]

Classification of finite Abelian groups

- List all Abelian groups of order 108.
- A finite Abelian group has order 16, and contains an element of order 8, but no elements of order 16. What is the group?

Classification of groups

11. (a) A group G is called *decomposable* if it is isomorphic to an external direct product:

$$G \cong H \times K,$$

where H, K are non-trivial groups; a group is called *indecomposable* otherwise. Prove that every finite group can be written in the form:

$$G \cong G_1 \times G_2 \times \dots \times G_n,$$

where G_i is an indecomposable group. [Well beyond the scope of this course, the Krull-Schmidt theorem states that these indecomposable factors G_i are unique up to isomorphism and reordering.]

- (b) Show that that Q_8 is indecomposable.

- (c) Let $r^\alpha m^\beta, r^{\alpha'} m^{\beta'} \in D_n$. Show that:

$$(r^\alpha m^\beta)(r^{\alpha'} m^{\beta'}) = (r^{\alpha'} m^{\beta'})(r^\alpha m^\beta)$$

if and only if $\alpha + (-1)^{\beta}\alpha' = \alpha' + (-1)^{\beta'}\alpha$ modulo n . Deduce that:

- rotations always commute;
- a rotation r^α and a reflection $r^{\alpha'} m$ commute if and only if $2\alpha = 0$ modulo n ;
- two reflections $r^\alpha m$ and $r^{\alpha'} m$ commute if and only if $2(\alpha - \alpha') = 0$ modulo n .

Hence, argue that D_n is indecomposable for $n \geq 3$.

- (d) Using parts (b) and (c), make a complete list of indecomposable groups up to and including order 11.
12. Is it true that if a group's non-identity elements all have order three, then the group must be Abelian? Provide a proof or counterexample as appropriate.
